DETAILED ACTION

Drawings

1. Figure 10 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-3 and 8 are rejected under 35 U.S.C. 102(e) as being anticipated by Stettner et al. (U.S. Patent 6,362,482).

Regarding claims 1-3 and 8, Stettner et al. disclose (see Figure 5) a method of comparing light intensity between pixels, comprising the steps of: integrating sensed output signals over time to provide an integrated signal for each of the photosensitive elements (21); interrupting the integration of a first sensed output signal of a first pixel at the end of a first time period and storing the resulting first integrated signal; continuing the integration of a second sensed output signal of a second pixel until the end of a second time period to provide a second integrated signal; and comparing (see 57 of Figure 7 and column 9, lines 40-50) the first and second integrated signals to provide an

output signal representative of an edge condition between the first and second pixels. That is, since the signals are integrated, at the end of a first time period integration inherently stops or is interrupted for the first pixel, and integration for the second pixel stops at a second time period. Since the integration times are not variable, the ratio between the second and first time periods is predetermined. Stettner et al. further disclose (see Figure 5) integrating current signals with a capacitive means (29). Stettner et al. also disclose (see column 9, lines 40-50) comparing light intensity of at least one adjacent pixel (contiguous).

Allowable Subject Matter

4. As allowable subject matter has been indicated, applicant's reply must either comply with all formal requirements or specifically traverse each requirement not complied with. See 37 CFR 1.111(b) and MPEP § 707.07(a).
5. Claims 4-7 and 9 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
6. Claims 10-27 are allowed over the prior art of record.
